Full Stack Engineer: React and Node.js

Dear Enterprise Bot hiring team,

I am applying for Enterprise Bot's Full Stack Engineer role in Bengaluru. The role's combination of React and TypeScript interfaces, Node.js services, integrations, and responsibility through production matches the work I want to contribute. I would bring experience connecting those layers, with particular attention to secure access, reliable APIs, and the operational details that keep a delivered feature useful.

At Osbee Solution Private Limited, where I have worked as a Full Stack Engineer since June 2025, I build and maintain an energy-sector platform. That work gives me concrete approaches to the responsibilities in your posting:

- Build React and TypeScript interfaces alongside Node.js services, connecting user workflows to backend APIs and database operations.
- Implement JWT, OAuth 2.0, and role-based access control, with Redis caching and TTL-based invalidation to reduce repeated authorization work.
- Carry integrations through delivery: I integrated DocuSign and Zoho APIs, saving approximately five hours of operations effort each week, and built CI/CD pipelines with Docker and GitHub Actions.

For your team, I would start by clarifying each feature's user flow, data requirements, and failure cases with Product and Design, then deliver the interface and service changes together. I would use Jest and React Testing Library where appropriate, review API behavior, and monitor the release in production. I would also document API decisions so other engineers can extend the work. My earlier work at CodingNinjas included collaboration with QA, Product, and UX across release cycles. I am open to Bengaluru's hybrid arrangement and have a 30-day notice period. I would welcome a discussion about the features you need delivered first.

Kind regards,

Mohammad Shahansha
